Inference for Multivariate Regression

Grinnell College

May 9, 2025

Cases

1.
$$y = \beta_0 + X\beta_1$$

2.
$$y = \beta_0 + 1_A \beta_1$$

3.
$$y = \beta_0 + \mathbb{1}_A \beta_1 + X \beta_2$$

4.
$$y = \beta_0 + \mathbb{1}_A \beta_1 + \mathbb{1}_B \beta_2$$

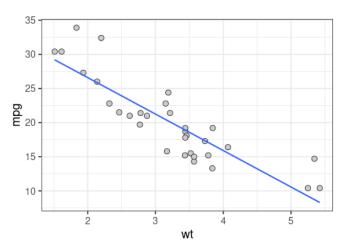

5.
$$y = \beta_0 + X_1\beta_1 + X_2\beta_2$$

- 1. Simple linear, β_1 shows change in y given change in X
- 2. Simple categorical, reference variable and group means
- Continuous and categorical, two regression lines with same slope but different intercept
- 4. Multiple categorical, combined reference variables
- 5. Multiple continuous, β_1 shows change in y given change in X_1 , assuming everything else held constant

Single Quantiative

Weight and MPG

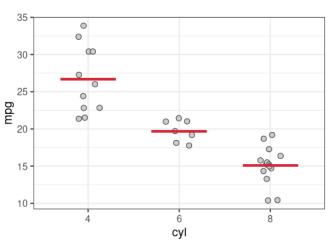

Single Categorical

Cylinder and MPG

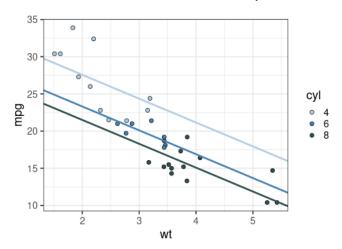

Categorical and Quantitative

```
1 > lm (mpg ~ wt + cyl, mtcars) %>% summary()
3 Coefficients:
           Estimate Std. Error t value Pr(>|t|)
5 (Intercept) 33.991 1.888 18.01 < 0.00000000000 ***
       -3.206 0.754 -4.25 0.00021 ***
6 wt.
7 cy16
         -4.256 1.386 -3.07
                                        0.00472 **
8 cv18
     -6.071 1.652 -3.67 0.00100 ***
11 Residual standard error: 2.56 on 28 degrees of freedom
12 Multiple R-squared: 0.837, Adjusted R-squared: 0.82
13 F-statistic: 48.1 on 3 and 28 DF, p-value: 0.000000000359
```

Cylinder, weight and MPG

$$\widehat{\mathsf{mpg}} = 33.99 - 3.21 \times \mathsf{weight} - 4.26 \times \mathbb{1}_{\mathsf{6cyl}} - 6.07 \times \mathbb{1}_{\mathsf{8cyl}}$$

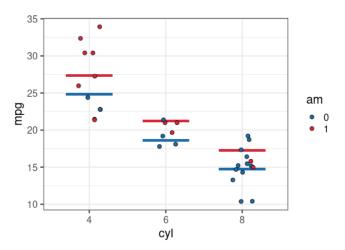

Multiple Categorical

```
1 > lm (mpg ~ cyl + am, mtcars) %>% summary()
3 Coefficients:
         Estimate Std. Error t value Pr(>|t|)
5 (Intercept) 24.80 1.32 18.75 < 0.00000000000 ***
6 cy16
     -6.16 1.54 -4.01 0.00041 ***
7 cy18
           -10.07 1.45 -6.93 0.00000015 ***
8 am1
             2.56 1.30 1.97
                                          0.05846 .
11 Residual standard error: 3.07 on 28 degrees of freedom
12 Multiple R-squared: 0.765, Adjusted R-squared: 0.74
13 F-statistic: 30.4 on 3 and 28 DF, p-value: 0.0000000596
```

Cylinder, transmission and MPG

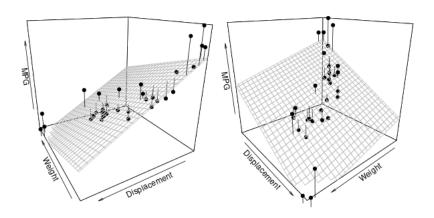

$$\widehat{\mathsf{mpg}} = 24.8 - 6.16 \times \mathbb{1}_{\mathsf{6cyl}} - 10.07 \times \mathbb{1}_{\mathsf{8cyl}} + 2.56 \times \mathbb{1}_{\mathit{Manual}}$$

Multiple Quantitative

Cylinder, transmission and MPG

$$\widehat{\text{mpg}} = 34.96 - 3.35 \times \text{weight} - 0.017 \times \text{displacement}$$

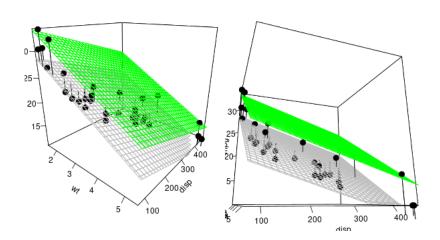

Multiple Quantiative and categorical

```
1 > lm(mpq ~ wt + disp + am, mtcars) %>% summary()
3 Coefficients:
          Estimate Std. Error t value Pr(>|t|)
5 (Intercept) 34.67591 3.24061 10.70 0.000000000021 ***
      -3.27904 1.32751 -2.47 0.020 *
6 wt.
7 disp -0.01780 0.00937 -1.90
                                          0.068 .
8 am1 0.17772 1.48432 0.12
                                           0.906
11 Residual standard error: 2.97 on 28 degrees of freedom
12 Multiple R-squared: 0.781, Adjusted R-squared: 0.758
13 F-statistic: 33.3 on 3 and 28 DF, p-value: 0.0000000225
```

Multiple quantiative with categorical

 $\widehat{\mathsf{mpg}} = 34.67 - 3.27 \times \mathsf{weight} - 0.018 \times \mathsf{displacement} + 0.17 \times \mathbb{1}_{\mathit{Manual}}$

Key Takeaways

- Quantitative variables represent slopes (changes in X lead to β changes in y)
- ► Categorical variables represent horizontal shifts
- Any number of categorical or quantitative variables can be added to model
- Lookout for correlated variables
- ▶ Always interpret regression coefficients as everything else being fixed
